The biggest surprise from the interview was when I had to define five separate skip reasons, missing category, missing amount, invalid amount, negative amount, and no budget for category. I also had to pick the exact wording for each one and the order they get checked in. I thought a bad row was just one thing, and honestly in my Week 2 project it was the model just decided on its own which rows to skip and how to describe them, and I never had to think about it. The interview made me realize that invalid was actually hiding four different decisions and each one mattered, because it compares the output line by line. That's what spec first development really does, it doesn't make you write more. It just makes you actually decide things instead of letting the model guess. My rewritten prompt worked the same way. It took choices the model used to make silently and turned them into rules I set myself.
